

Configuring the Ward Map

The Ward map on the Katalog app allows your citizens to easily look up what ward an address is located in. This document describes how to configure this map so that it will be visible in your community's map list and function properly.

Required Layers

This map requires two layers to be configured in your Layer Table:

- Address This is a point feature layer. When the layer is published, it should include the style and labeling that you want to appear when the map is loaded in the Katalog app. In the Layer Table entry for the address layer, you need to include a value for the Search Field attribute. This needs to be a text field in your address layer that fully identifies a unique address (e.g. "110 MAIN ST APT #3").
- Ward This is a polygon feature layer representing the different wards in your community. In the Layer Table entry for the ward layer, you need to include a value for the Search Field attribute. This needs to be a text field in your ward layer that identifies the name of the ward (e.g. "Ward 2").

Layer Table Configuration

The image below shows an example of how to fill out the Layer Table for the two required layers. The name of the layer is selected in the dropdown for the Layer attribute. The URL attribute is populated with the REST endpoint URL for each layer. The Search Field attribute is also populated for the address and ward layers. The Configuration Table attribute can be left blank for both layers.

Layer	URL	SearchField	ConfigurationTable
Address	https://services8.arcgis.com/Ic8uIACZfrvb7Y11/arcgis/rest/services/Addresses/FeatureServer/0	FULLADDR	
Ward	https://services8.arcgis.com/Ic8uIACZfrvb7Y11/arcgis/rest/services/Wards/FeatureServer/0	WARD	

Editing of the Layer Table in ArcGIS Pro. ArcGIS Pro is a trademark of Esri. (esri.com)

Popup Table Configuration

Use the **Popup Table** to configure which attributes will show up for an address or ward when they are clicked on by the user. Use the dropdown for the layer attribute to select whether it is a field in the address or ward layer. Enter in the name of the field in the fieldName column. Lastly,

in the label column, enter in how you want that value to be labeled in the popup. The image below shows an example of a configuration for the address and parcel popup fields.

layer	fieldName	label
Address	FULLADDR	Full Address
Address	FIREDST	Fire District
Address	POLICEBEAT	Police Beat
Address	COUNTRY	Country
Address	STATE	State
Ward	WARD	Ward Number
Ward	MAYOR	Mayor
Ward	ALDERMAN1	Alderman 1
Ward	ALDERMAN2	Alderman 2
